- Exemplo 5

Exemplo 1

Matriz de zeros

Escreva uma função que receba dois números inteiros positivos n e m , e retorne uma matriz de tamanho $n \times m$ talque todos os seus elementos são zero.

Estratégia 1:

Criar linha x linha e adicionar na matriz.
Usar uma variavel auxiliar para cada linha

Python 3.6
([known limitations](#))

```
→ 1 def zeros1(n,m):  
  2     A = []  
  3     for i in range(n):  
  4         linha = []  
  5         for j in range(m):  
  6             linha.append(0)  
  7         A.append(linha)  
  8     return A  
  9  
10  
11  
12 A = zeros1(2,3)
```

Exemplo 2

Produto de duas matrizes

Escreva uma função que recebe duas matrizes (A e B).

Se as duas matrizes tiverem dimensões compatíveis, sua função deve retornar o produto das duas ($C = A \times B$). Caso contrário, sua função deve retornar uma lista vazia.

Exemplos

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \times \begin{bmatrix} 5 \\ 6 \end{bmatrix} = \begin{bmatrix} 17 \\ 39 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \cdot \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

$$\begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

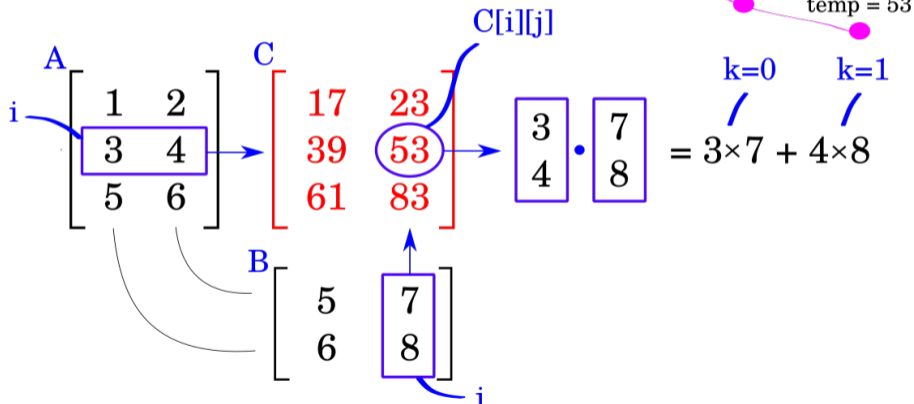

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \times \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} = \begin{bmatrix} 17 & 23 \\ 39 & 53 \\ 61 & 83 \end{bmatrix}$$

Estratégia 1:

Criar linha a linha e adicionar na matriz,
acumular produto escalar.

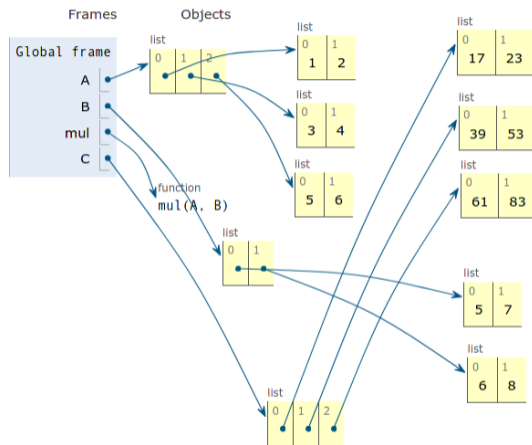

```

1 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
2
3 def mul(A,B):
4     if len(A[0]) != len(B):
5         return []
6     else:
7         C = []
8
9         for i in range(len(A)):
10            linha = []
11            for j in range(len(B[0])):
12                temp = 0
13                for k in range(len(B)):
14                    temp+=A[i][k]*B[k][j]
15                linha.append(temp)
16            C.append(linha)
17        return C
18
19 C = mul(A,B)

```

Estratégia 1:

Criar linha a linha e adicionar na matriz, acumular produto escalar.

```

1 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
2
3 def mul(A,B):
4     if len(A[0]) != len(B):
5         return []
6     else:
7         C = []
8
9         for i in range(len(A)):
10            linha = []
11            for j in range(len(B[0])):
12                linha.append(0)
13                for k in range(len(B)):
14                    linha[j]+=A[i][k]*B[k][j]
15
16            C.append(linha)
17        return C
18
19 C = mul(A,B)

```

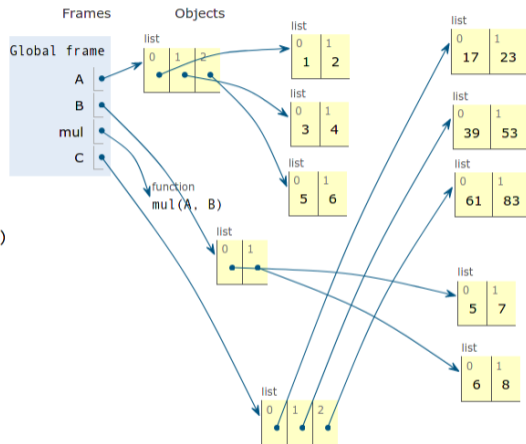

Estratégia 2:

Criar linha a linha e adicionar na matriz, acumular produto escalar diretamente na linha.

```

1 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
2
3 def mul(A,B):
4     if len(A[0]) != len(B):
5         return []
6     else:
7         C = [[0 for j in range(len(B[0]))] for i in range(len(A))]
8
9         for i in range(len(A)):
10            for j in range(len(B[0])):
11                for k in range(len(B)):
12                    C[i][j]=sum([A[i][k]*B[k][j] for k in range(len(B))])
13
14            return C
15
16
17 C = mul(A,B)
18
19

```

Estratégia 5:

Inicializar a matriz com zeros,
 usar "sum" para calcular o produto escalar.

```
1 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
2
3 def mul(A,B):
4     if len(A[0]) != len(B):
5         return []
6     else:
7
8
9
10
11
12
13
14
15     C = [[ [sum([A[i][k]*B[k][j] for k in range(len(B))]) ] for j in range(len(B[0]))] for i in range(len(A))]
16
17     return C
18
19 C = mul(A,B)
```

Estratégia 6:

Usando "List Comprehensions"
para criar de forma concisa "inline" toda a matriz

```
1 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
2
3 def mul(A,B):
4     if len(A[0]) != len(B):
5         return []
6     else:
7         return [[ [sum([A[i][k]*B[k][j] for k in range(len(B))]) ] for j in range(len(B[0]))] for i in range(len(A))]
8
9
10
11
12
13
14
15
16
17
18
19 C = mul(A,B)
```

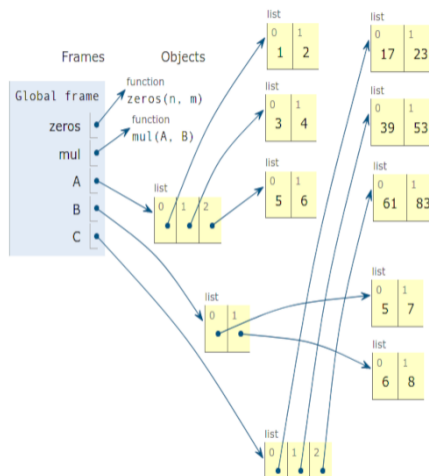

Estratégia 6:

Inicializar a matriz com zeros,
construção inline.

```

1 def zeros(n,m):
2     return [[0 for j in range(m)] for i in range(n)]
3
4 def mul(A,B):
5     if len(A[0]) != len(B):
6         return []
7     else:
8         n,m = len(A), len(B[0])
9         C = zeros(n,m)
10
11        for i in range(n):
12            for j in range(m):
13                C[i][j]=sum([A[i][k]*B[k][j] for k in range(len(B))])
14
15        return C
16
17
18 A,B = [[1,2],[3,4],[5,6]],[[5,7],[6,8]]
19 C = mul(A,B)

```

Estratégia 7:

Usando a funções para quebrar o problema.

Percorrer a matriz explicitamente.

Exemplo 3

Matriz Diagonal

Escreva uma função que dada uma matriz quadrada, verifique se ela é uma matriz diagonal.

<https://pythontutor.com/visualize.html#mode=edit>

```

1 def zeros(n,m):
2     return [[0 for j in range(m)] for i in range(n)]
3
4 def verifica_diagonal(A):
5     for i in range(len(A)):
6         for j in range(len(A)):
7             if (i!=j) and (A[i][j]!=0):
8                 return False
9     return True
10
11 A = zeros(3,3)
12 A[2][2] = 14
13 print(verifica_diagonal(A))
14
15 A[1][2] = 10
16 print(verifica_diagonal(A))

```

<< First < Prev Next > Last >>

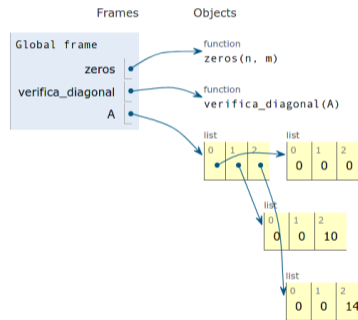

Done running (80 steps)

Print output (drag lower right corner to resize)

```

True
False

```

Estratégia:

Percorrer a matriz, reconhecer um elemento não diagonal

Exemplo 4

Triangular Inferior

Escreva uma função que dada uma matriz quadrada, verifique se ela é uma matriz triangular inferior.

<https://pythontutor.com/visualize.html#mode=edit>

```

1 def zeros(n,m):
2     return [[0 for j in range(m)] for i in range(n)]
3
4 def verifica_triangular_inferior(A):
5     for i in range(len(A)):
6         for j in range(len(A)):
7             if (i<j) and (A[i][j]!=0):
8                 return False
9     return True
10
11 A = zeros(3,3)
12 A[2][2] = 14
13 print(verifica_triangular_inferior(A))
14
15 A[1][2] = 10
16 print(verifica_triangular_inferior(A))

```

<< First

< Prev

Next >

Last >>

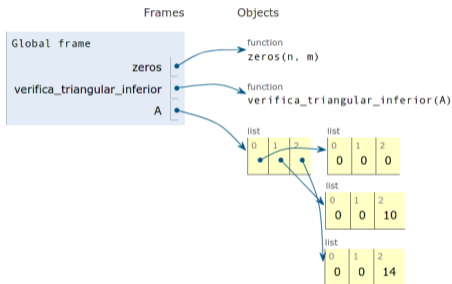

Done running (80 steps)

Print output (drag lower right corner to resize)

```

True
False

```

Estratégia:

Percorrer a matriz, reconhecer um elemento acima da diagonal

Exemplo 5

10. Uma matriz quadrada de números inteiros é um *quadrado mágico* se o valor da soma dos elementos de cada linha, de cada coluna e da diagonal principal e da diagonal secundária é o mesmo. Além disso, a matriz deve conter todos os números inteiros do intervalo $[1..n \times n]$. Exemplo:

$$\begin{bmatrix} 15 & 8 & 1 & 24 & 17 \\ 16 & 14 & 7 & 5 & 23 \\ 22 & 20 & 13 & 6 & 4 \\ 3 & 21 & 19 & 12 & 10 \\ 9 & 2 & 25 & 18 & 11 \end{bmatrix}$$

A matriz acima é um quadrado mágico, cujas somas valem 65. Escreva um programa que, dada uma matriz quadrada, verifique se ela é um *quadrado mágico*.

<https://pythontutor.com/visualize.html#mode=edit>

```

1 A = [[4,9,2],[3,5,7],[8,1,6]]
2
3 def verifica_cuadrado_magico(A):
4     n = len(A)
5     X = list(range(1,n*n+1))
6     for i in range(n):
7         for j in range(n):
8             if A[i][j] in X:
9                 X.remove(A[i][j])
10            else:
11                return False
12    soma = sum(A[0])
13    for i in range(1,n):
14        if soma != sum(A[i]):
15            return False
16    for j in range(n):
17        if soma != sum([A[i][j] for i in range(n)]):
18            return False
19    if soma != sum([A[i][i] for i in range(n)]):
20        return False
21    if soma != sum([A[i][n-1-i] for i in range(n)]):
22        return False
23
24    return True
25
26 print(verifica_cuadrado_magico(A))

```

Print output (drag lower right corner to resize)

True

Estratégia:

Reconhecer as somas a validar
